Integrate R StateEt as Eclipse Plugin

Follow these steps to install the R StatET

eclipse plugin on Windows. The installation

instructions are at

http://www.walware.de/goto/statet

Step 1: First, install R using the web site: <u>http://cran.us.r-project.org/</u>

Make sure you remember the folder in which you choose to save R.

Next install the packages rj and rJava. Install the R packages rj from the website: <u>http://www.walware.de/?page=/it/downloads/rj.mfr</u> <u>ame</u> You can do that in the rGui. For example, if R is in the file location C:\Program Files\R\R- x.x.x The Rgui.exe is then found at C:\Program Files\R\Rx.x.x\bin\i386 Next enter the following three command into the Rgui:

```
install.packages(c("rj", "rj.gd"),
repos="http://download.walware.de/rj-
1.1")
install.packages("rJava")
```

These packages can be copied into the folder:

.../R- x.x.x /library.

Step 2: Go to the site which hosts the

WalWare plugin software

http://www.walware.de/goto/statet

Follow the installation link on this site to

get the URL from which Eclipse can be

download and install the software.

Step 3: Install Eclipse

http://www.eclipse.org/downloads/

I downloaded

eclipse-jee-kepler-SR1-win32-x86_64.zip

and unzipped it into my C:\Program Files folder. I also added the eclipse executable to my task bar by using a right click on the eclipse application and choosing the option:

Name	Date modified	Туре	Size
👢 configuration	11/27/2013 3:45 PM	File folder	
👢 dropins	9/19/2013 6:07 AM	File folder

epl-v10	11/27/2013 3:45 PM	HTML File	17 KB
notice	11/27/2013 3:45 PM	HTML File	10 KB

add to task bar.

Step 4: Install the StatEt software into

Eclipse by using the instructions at

http://help.eclipse.org/kepler/index.jsp?topi

c=/org.eclipse.platform.doc.user/tasks/tasks-124.htm

Open Eclipse and go to

Help -> Install New Software.

Step 5: Paste the URL for the Eclipse version you chose

into the box. I chose

http://download.walware.de/eclipse-4.3

Click Add and then select All

Continue to select next and accept the terms and conditions. Finally restart Eclipse.

Step 6: Select the R Environment preference page by

clicking on the red circle below:

(Another way to get to this screen is to use the "Window" pull down tab at the top of the screen and

selecting: Window>preferences>StatET>Run/Debug>R Environments)

Clicking on the 'Add...' button opens the dialog to specify the new R environment.

۲		ОК	Cancel	Properties/Settings ' button to load	

Next let eclipse know where you downloaded R in your file system. Fill out the form as given below. By clicking on the small + sign you can browse your file system. Finally, click on "Detect Default Properties/Settings" and then click on OK.

	•		Add R Enviro	onment Configuration		_ 🗆 🗙

F	Include files ('R_INC	CLUDE_DIR'):	\${env_var:R_HOME}/inclue	de		+
1	?				OK	Cancel

Step 7: Set up the console.

First, notice that you can open the StatET perspective by clicking on the box in the top right corner and choosing StatET. Another way to open it is under the Window tab selecting Window>Open Perspective>Other>StatET.

Go to the menu: Run > Run Configurations as below:

Note that it is possible to create multiple R consoles. By selecting 'R Console', options for creating a new console, copying a console, or deleting a console are given. When creating a new console, a dialog form will appear. In the run dialog select 'R Console' and click the 'New launch configuration' button. Enter a name for the configuration, for example 'R-3.0.2'.

In the Main tab you can specify the working directory. (I have my data sets stored in the folder C:\Dev\workspaceR\TestDataSets.) You can leave it blank then the R system will choose the default working directory. Or you could enter variables like \${project path}. Then in this case the working directory for the R session will be set to the selected project in the 'Navigator' view.

In the Main tab you can also specify R start up options. For example, --silent causes R to start up without printing start up messages. Another Main tab option is --no-save or --no-restore, to be used when invoking R.

After clicking on 'Apply', the new console is created.

Next, go to the 'R Configuration' tab and select an R configuration (I selected R-3.02 which is the version

of R for this console.) Now click on 'Apply' to save the configuration.

•		Run Configurations		×
Create, manage, and run config Run a R Console.	urations			
Image: Second	Name: R-3.0.2 Main @ R Config R Con R Environment Workbench Default: Selected Configuration:	Isole Tenvironment JRE & Java Classpath & S R-3.0.2 R-3.0.2	iource)	Configure
Jy Task Context Test Filter matched 12 of 12 items			Apply Run	Revert

Step 7: Now it is time to start the R console by

clicking on 'Run' to run the R console (as seen at the bottom right of the previous screen shot). After 'Run' is clicked, the console appears as in the following screen shot:

Note that sometimes you may not run the R console, the 'Run' button is grayed. This can happen for example when no project is selected but you have set R to start with \${project path} as the working directory.

Once the R Console has been setup, the next time you start Eclipse it can be ran again from the 'Run As' button menu on the main toolbar of Eclipse as highlighted below:

Step 8: Run an R program

Commands can be typed into the R console and will be executed simply by hitting the 'Enter' key. New R scripts can be created by using the 'File' pull down menu and selecting File>New>R Script File as seen in the following screen shot:

The following Run options are taken verbatim from Lam's document. Run R Script in R via `source': The complete contents of the text editor is entered in R through the source command in R. In contrast to the above method, only one command is run in R: source(<selected text file>)

Run R selection/current line in R: If a block of code is selected then only that block of code is sent to R. If nothing is selected, only the current line (the line of code where the cursor is) is sent to R.

Run R selection/current line in R and go to the next line Does the same as the above but moves the cursor to the next line in the text editor. This might be useful to run some block of statements line by line.

Run Function Definition in R This option is not accessible from the menu but is accessed by the short cut key Ctr+R, Ctr+F. In a text editor, if the cursor is in a function definition then use the short cut key to submit the function definition. StatET will recognize the beginning and the ending of the function. The user does not need to select the whole function and use `run R selection' to define the function.
